EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to Applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Mr. Everett Diederiks, Jr. (Reg. No. 33,323) on August 1, 2006.

The application has been amended as follows: Claims 14-19 have been deleted.

REASONS FOR ALLOWANCE

2. The following is an examiner's statement of reasons for allowance: The claims are allowable because the prior art fails to teach a cutting head system with a spring member extending within the head member, the centering element being retractably mounted within the head member, with the spring member biasing the centering element outward from the head member as set forth in claims 1 and 2, and a cutting element holder having a first edge portion detachably secured to the head member and a second edge portion defining a cutting blade receiving recess as set forth in claims 10 and 22.

Regarding claims 1 and 2, Koepfinger (3,062,299) discloses a cutting head system adapted to be rotated in order to trim around a head cover (48) having a head cap provided with a centering member (12/30) substantially as claimed, comprising: a head member (10) having a peripheral edge portion interconnected to a central hub (connection of arms/"webs" 54) through an intermediate web portion (54), said head

member (10) being adapted to extend about a head cover (48); a cutting element (50) projecting from the peripheral edge portion of the head member (10); a drive shaft member (14) having a driven end portion extending to a driving end portion, said driving end portion being drivingly connected to the head member (10); a centering element housing (28) extending into the head member (10), said centering element housing (28) having a first end secured to the head member (10), a second end, and a hollow cylindrical main body portion extending there between; and a centering element (12/30) extending within the head member (10) and projecting beyond the cutting element (50), said centering element (12/30) being adapted to engage with the centering member of the head cap (48) to center the head member (10) about the head cover such that, upon application of a driving force to the driven end portion of the drive shaft (14), the head member rotates about the head cover (48) causing the cutting element to trim grass growing around the head cover (48); and a spring member (20). Koepfinger fails to disclose a spring member extending within the head member, said centering element being retractably mounted within the head member, with the spring member biasing the centering element outward from the head member.

Regarding claims 10 and 22, Koepfinger discloses a cutting head system substantially as claimed (see above), but fails to disclose a cutting element holder having a first edge portion detachably secured to the head member and a second edge portion defining a cutting blade receiving recess.

The above prior art by itself or in combination with the other prior art cited fails to teach the claimed invention set forth in claims 1, 2, 10, and 22.
